

This work package only deals with type 2 vehicle (for high-speed long-range transportation).

From the few characteristics given for type 2 vehicle capable of high-speed long-range transportation, you will define a set of high-level requirements that impact both vehicle design and trajectory. You will add some other constraints linked to the fact that use of the vehicle is close to airliner or business jet ones, while offering a concept allowing two hour door-to-door trips

Your final file will at least contain:

- trajectory profile,
- a pre-project type architecture of vehicle, with the design, geometric and mass characteristics.

General characteristics of reference vehicles:
